Economics of Health Care

Identifying health care costs
The rising costs of health care create an unsustainable burden on consumers, employers and government. It’s important that members of Blue Cross and Blue Shield of Illinois (BCBSIL), Blue Cross and Blue Shield of New Mexico (BCBSNM), Blue Cross and Blue Shield of Oklahoma (BCBSOK), and Blue Cross and Blue Shield of Texas (BCBSTX), divisions of Health Care Service Corporation, a Mutual Legal Reserve Company, as well as the general public, know how health insurance premium dollars are being spent. More important, there is a need for education and awareness about what truly drives costs and how to help keep down these expenses. While most Americans use health care, few really know where their money goes and what medical care and services actually cost.

Federal government data confirms that rising health care costs are driven by increased spending on hospital care, physician services, prescription drugs and other medical services. As the dollar image on the next page illustrates, 87 percent of every health insurance premium dollar is used to pay for such direct medical care. These medical treatment costs are rising at two to three times faster than the rate of inflation. But with the greatest challenge comes the greatest opportunity.
Hospital Costs (35%)—According to a study by Thomson Reuters, the average profit margin of America's hospitals reached more than 8 percent in the second quarter of 2009. Hospitals, especially those with strong market power, have reaped higher revenues from private payers. This has led to weaker cost controls and higher costs per unit of service. Data gathered by the American Hospital Association revealed that, from 1999 to 2007, private insurers’ payment-to-cost ratio increased 17 percent, while Medicare’s same payment-to-cost ratio decreased 9 percent. This process is shifting the costs from Medicare to private insurers, requiring them to pay increasingly more.

Inpatient Services—Inpatient services include items and services ordinarily furnished by the hospital for the care and treatment of patients staying overnight. Patients may be admitted to the hospital for various reasons—giving birth, undergoing surgery, etc.

Outpatient Services—Outpatient hospital services include less complicated procedures that do not require an overnight stay in the hospital. These generally occur when an individual visits the hospital to prevent sickness, get a diagnosis for a health condition or an illness, alleviate pain, or receive rehabilitation services. Emergency room visits also can be an outpatient service. Claims data from the period of April 2009 through March 2010 shows that BCBSIL, BBSNAM, BCBSOK and BCBSTX members were charged an average of $2,160 per emergency room visit, including facility and professional costs.
Physician Services (33%) – Physician services include the cost of patient care, such as salaries, facilities, technology and medical malpractice lawsuits.

Prescription Drug Costs (14%) – In February, *Forbes* magazine released its list of the most expensive drugs, including one drug that cost $409,500 for a year’s supply – meaning it costs more than $1,000 per day, every day, all year. Some people argue that such prices are necessary due to drug research, development, manufacturing and marketing. However, the pharmaceutical industry benefits from a 19 percent profit margin and is currently ranked the third most profitable industry in America.

Other Medical Services (5%) – These costs include durable medical equipment, orthotics, therapy, hospice, skilled nursing services and other ancillary provider services.

Administrative Government Costs (6%) – Payments to the government include taxes, mandates and compliance. These costs also include claims processing and other administrative costs.

Consumer Services (4%) – These costs include prevention services that help members stay healthy, as well as medical management programs, provider support and health information technology investments – all of which help to avert millions of dollars a year in unnecessary medical costs.

Insurer Margin (3%) – Typically, non-investor-owned companies like Health Care Service Corporation operate with a margin of less than 3 percent. As a non-investor-owned company, we do not trade stock publicly.

*Rather than returning earnings to shareholders, we retain earnings as capital reserve. This secures our ability to meet financial obligations, including claims payments.*

The non-investor-owned model ensures that the monthly rates members pay are put to good use. Now, more than ever, health care customers need this structure and certainty.
Controlling health care costs is no simple task and will require the combined effort of the government, insurers, providers and the general public. As economic difficulties may pressure healthy individuals to go without insurance, the market includes a disproportionate number of unhealthy people who incur higher health costs. In addition, unemployment drives up the number of uninsured which may increase the number of expensive visits to the emergency room.

As the country’s largest non-investor-owned health insurer and fourth largest health insurer overall, with 12.4 million members, we make every effort to keep coverage affordable and accessible. We’re committed to working with hospitals, physicians and employers to provide access to quality medical care at competitive rates. Most other insurance carriers are for-profit and focus their attention on the locations with the most reliable profitability.

As a non-investor-owned company, our members are our shareholders, and we operate our business to their benefit. While investor-owned or publicly traded companies are forced to maximize shareholder value, we do not have this burden. This freedom allows us to better align our incentives and concentrate all our resources on our customers. The non-investor-owned model also enables us to focus on the long-term needs of policyholders instead of the short-term gains of shareholders.
